HOW UVC WORKS?

Ultraviolet C (UVC), also known as germicidal UV, is the **shortest wavelength** of ultraviolet radiation, ranging from 200–280 nm. This radiation is completely absorbed by the Earth's ozone layer and atmosphere. UVC has a powerful antimicrobial effect, **targeting the DNA and RNA of microorganisms**. By disrupting their ability to reproduce, UVC effectively halts the growth of bacteria, viruses, fungi, and mold, including antibiotic-resistant strains like MRSA.

- CE-certified and tested
- Designed and assembled in Finland
- Durable – two-year warranty
- Environmentally friendly – recyclable materials
